HORIZONTAL FEED MIXERS

Keşif Feed Mixer

About the product

This new feed mixer is built above all for high reliability and a long service life with minimal maintenance. With its 220w single-phase motor (it can run on household electricity), its single auger and the specially designed knives mounted on it, it breaks up straw, alfalfa and hay bales packed by balers. It mixes maize silage, crushed beet or beet pulp, bran, feed and other additives into a homogeneous mix. It is also an ideal machine for small farms.

Benefits of a feed mixer: it improves feed efficiency, reduces digestive and metabolic problems, increases milk and meat production, reduces feed waste and brings a visible change in animal health.

Horizontal feed mixers are available from 1.5 m³ to 16 m³. We have been manufacturing feed mixers since 1996. Our factory is in Afyon, and through our dealers and our exports to more than 11 countries we serve farmers and farms in Türkiye and abroad. Feed mixers are an indispensable way to increase milk and meat production. Once you start using a feed mixer, you will soon see the change in your animals. Feed mixers also reduce feed consumption, so you save feed, which lowers your feed costs. Your animals will look bigger and healthier. A feed mixer minimises digestive problems in your animals and reduces your veterinary costs. If you want healthier animals, lower costs and higher yields, a feed mixer will be your indispensable partner.
